Gene Expression And Regulation

Pre-Transcriptional

- DNA Methylation: Addition of methyl groups to DNA, silencing gene expression.
- Histone Modifications: Chemical changes to histone proteins, influencing chromatin structure.
- **Transcription Factor Binding:** Activation or repression of gene transcription by specific proteins.

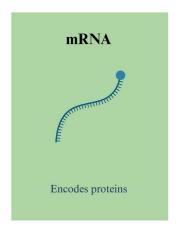

(Post)Transcriptional

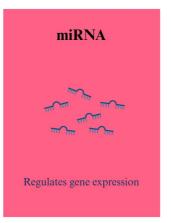

- **RNA Splicing:** Removal of introns and joining of exons to generate diverse mRNA isoforms.
- **mRNA Stability:** Regulation of mRNA half-life influences translation.
- **MicroRNAs (miRNAs):** Small RNAs bind to mRNA 3' UTR, leading to degradation or translation inhibition.

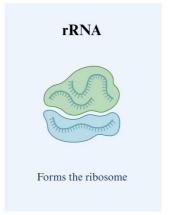

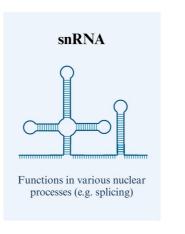

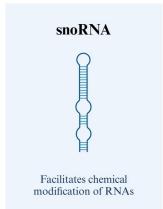

Transcriptome

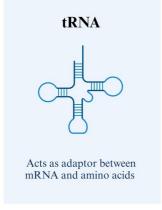

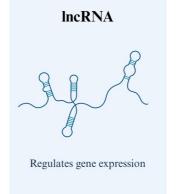

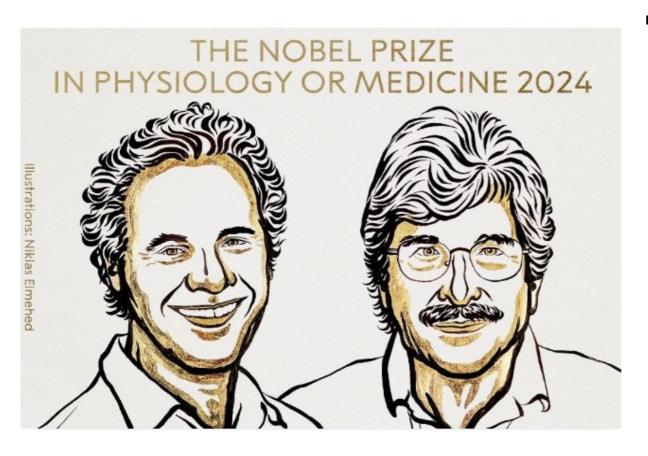

- •Transcriptome is a vast collection of RNA molecules transcribed from DNA
- •Significant proportion of the transcriptome consists of non-coding RNAs (ncRNAs, up to 90 %), which do not code for proteins but play pivotal regulatory roles
- •Non-coding RNAs add intricate layers of gene regulation and contribute significantly to the complexity of cellular processes.

'The Nobel Assembly at the Karolinska Institutet has today decided to award the

2024 Nobel Prize in Physiology or Medicine

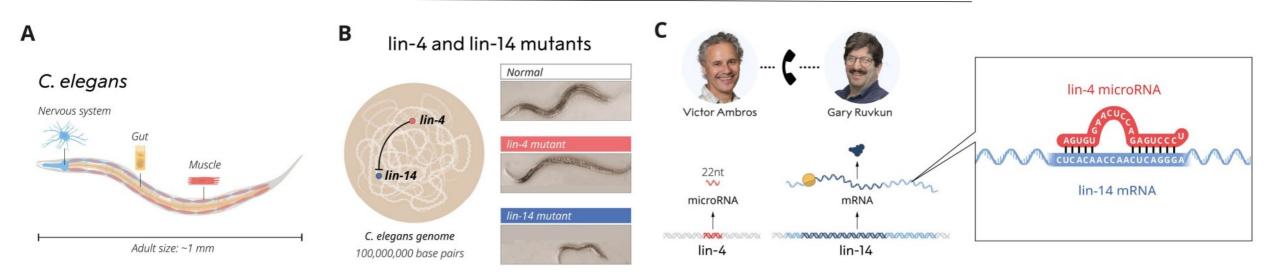

jointly to Victor Ambros and Gary Ruvkun

for the discovery of microRNA and

Nobel Price 2024

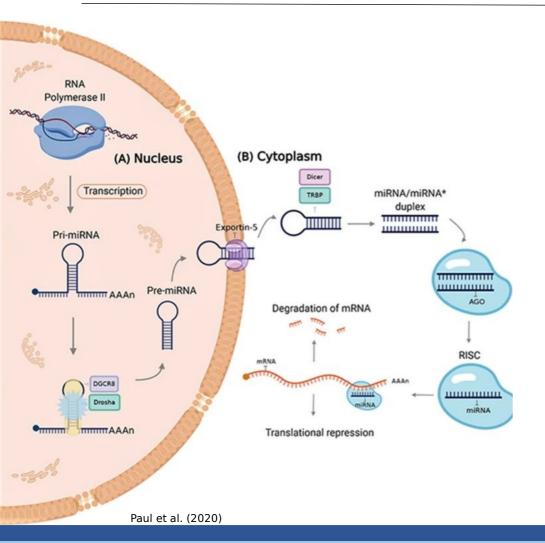

Discovery of microRNAs (lin-4): Ambros and Ruvkun found that the lin-4 gene in *C. elegans* produces a tiny RNA molecule (microRNA) that binds to complementary sequences in the lin-14 mRNA, blocking protein production and ensuring proper timing of developmental stages.

microRNA regulation

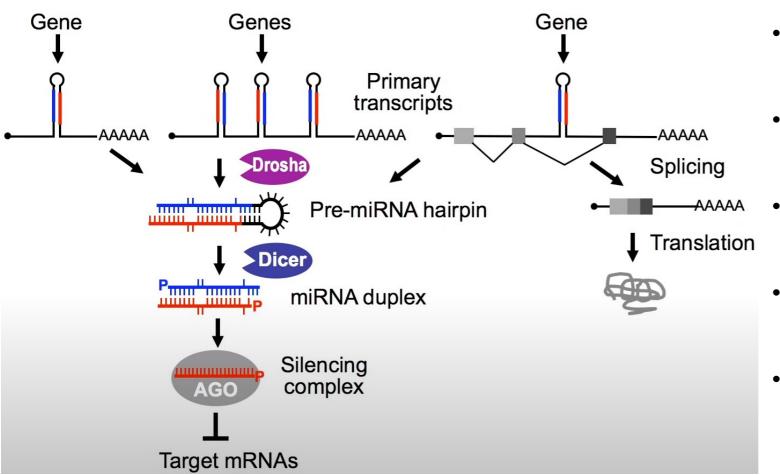

- microRNAs are small non-coding RNAs (22nt)
- Approximately 2500 human microRNAs
- Key-proteins: Drosha, Dicer, Argonaute
- Binding of microRNA seed in silencing complex to complementary 3' untranslated region of mRNA
- Lead to translational repression/ mRNA degradation
- microRNA families often enriched in targets of transcription factor s (redundant functions)

microRNA regulation

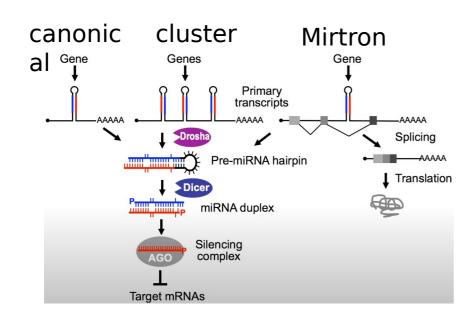

- Approximately 2300 microRNA genes
- Different primary transcripts (up to 6)
- Multiple microRNAs can be within one ORF
- Multifunctional transcripts (MIRTRONS)
- Non-concial biogenesis can avoid Drosha/Dicer dependency

Paul et al. (2020)

Ex.1 Explore microRNA genes

Use the UCSC genome browser (https://genome.ucsc.edu/) to explore human MIR17HG, MIR1224 and MIR155 and answer the following questions:

Which one is the 'canonical' microRNA gene?

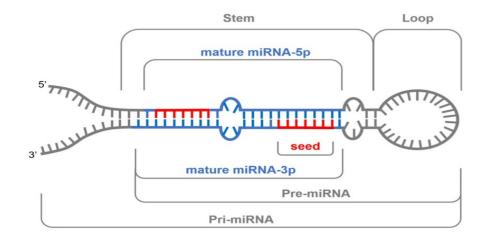

Which one is the Mirtron and whats the host gene?

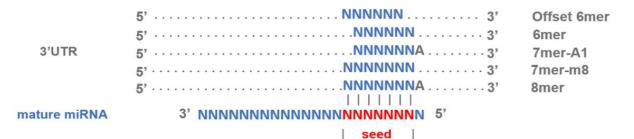

Which one is the microRNA cluster gene and how many hairpins does it have?

microRNA regulation

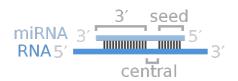

Marmol-Sanchez et al. (2020)

- Drosha 3' cut leaves a 2 nt overlap and Dicer 5' cut leaves a 2nt overlap
- Strong propensity for one of both mature strands
- Many microRNA binding sites in 3'UTRs are broadly conserved
- Multiple microRNA binding sites for the same microRNA family
- >60% of protein coding genes are targeted

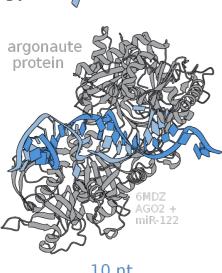

microRNA regulation

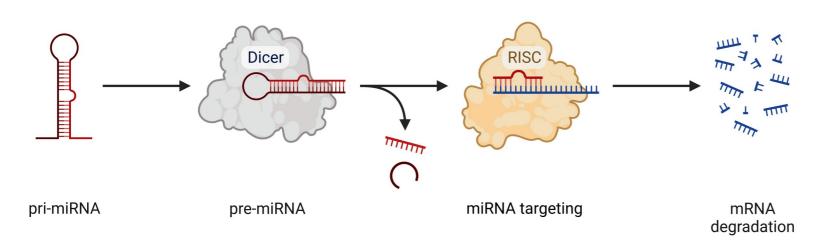

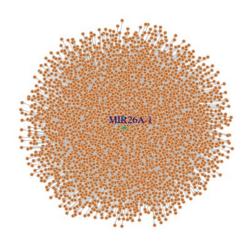

- Mature microRNA is loaded into argonaute protein
- microRNA seed (nt 2-8 from 5' end in mature microRNA) binds to complementary 3'UTR sequence of the gene
- 3'UTRs of mRNAs can be really long; on average 800 nt, but up to 10,000 nt
- Searching only complementary sequences leads to many false positives
- Integrate further information for scoring of miRNA-mRNA interactions

microRNA Regulation

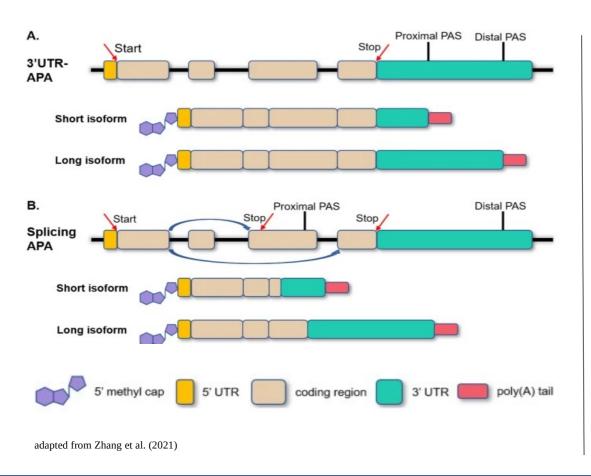

- **Diverse Binding**: MiRNAs can target multiple mRNAs, and one mRNA can have multiple miRNA binding sites due to imperfect complementarity.
- **Complex Prediction:** Predicting miRNA binding sites is challenging because it involves various factors and is not solely based on sequence matching.
- **Experimental Validation**: Accurate validation of miRNA-mRNA interactions often requires experimental techniques in addition to computational predictions.

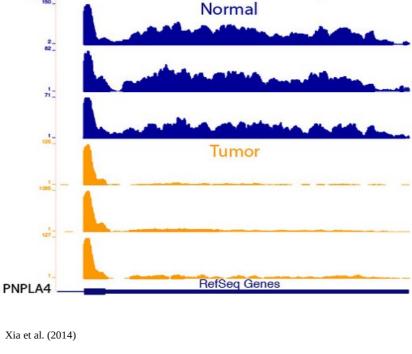

Alternative Polyadenylation regulates microRNAs

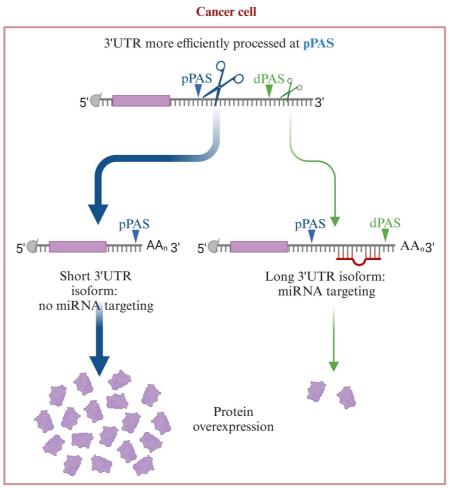

DaPars Algorithm / TC3A database

Alternative Polyadenylation

Normal cell 3'UTR equally processed at pPAS and dPAS pPAS pPAS dPAS <u>шшішші</u> АА_пЗ' Long 3'UTR isoform: Short 3'UTR isoform: miRNA targeting no miRNA targeting Normal protein expression

Experimental microRNA detection

METHOD	DISADVANTAGES	ADVANTAGES								
Northern blotting	Low-throughput-Low sensitivity-Laborious and very	High specificity-Readily available and easy-to-perform								
In situ hybridization	time consuming Low-throughput/Semi- quantitative	Monitor cellular and sub-cellular distributions/spatiotemporal expression profile								
Reverse transcription(RT-qPCR)	Cannot identify novel miRNAs	High sensitivity and specificity - Can be used for absolute								
Microarray	Low-sensitivity and specificity/ Cannot identify novel	quantification Comparing the relative abundance of specific miRNAs/low cost								
Next generation sequencing	gubstantial computational work required	Very high sensitivity-High accuracy in distinguishing variants of miRNAs								

Experimental microRNA detection

MIRNA-SEQ LIBRARY PREPARATION A Isolate 5ug of total RNA from your sample TOTAL RNA ISOLATION B Size fractionate total RNA using denaturing PAGE SIZE FRACTIONATION Select small RNA fraction (17-25 nt) 3' adapter ligation ADAPTOR LIGATION 6 5' adapter ligation Reverse transcribe RNA RT & PCR © PCR amplify sequences Flow Cell Attachment & Bridge Amplification SEQUENCING* Annealing of Sequencing Primers & Base extension Sequencing: Base Call, Deblock Extension,

*Illumina sequencing method depicted however other sequencing platforms can also be used.

- A profile of all small RNAs and miRNAs in the transcriptome
- Small RNA targets are enriched through size selection using sizeexclusion gels or commercially developed kits
- Follow RNA-seq procedure
- Bias because of degradated RNA fragments

Ex.2 Annotate microRNAs

Exercise 1: Find the (hsa-) microRNA sequence from the sequences_mirna.fa-file using

blast (https://blast.ncbi.nlm.nih.gov/Blast.cgi)

>sequence_1

RNA Secondary Structure

3D-structure of tRNA

- Not only proteins and DNA have secondary structures
- Structured RNA is involved in all aspects of gene expression
- mRNAs are often structured in terminal regions
- Watson-Crick-pairing is preferred, but not as prominent as in DNA
- GU pairing creates wobbles (distinct hydrogen bonds)
- Mismatches can have similar stability

RNA Secondary Structure

Ex.3 microRNA folding

- 1. Use the RNAfold webserver to compute the secondary structure of prior annotated microRNA sequence. microRNA 26a-1
- 2. Find the 22 nt mature microRNA-3p and 5p sequences. (*Tip: Dicer 5' cuts closing basepairs of*

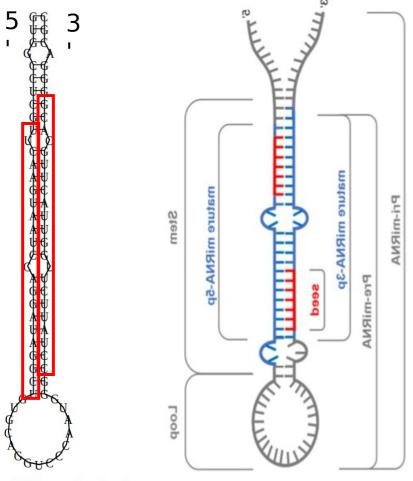

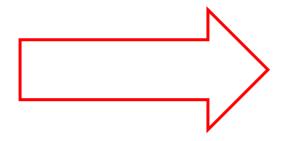

Sol.3 microRNA folding

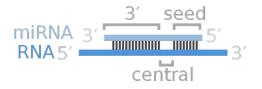

Check further Information on miR Search for hsa-mir-26a-5p

MFE secondary structure

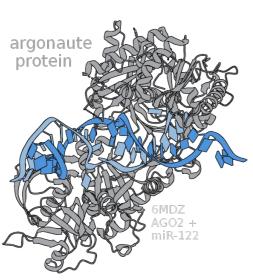

Ex. 4 microRNA seed

- How many human genes are potentially targeted by previously identified mature microRNA (hsa- miR-26-5p)? (www.targetscan.org/vert 80/)
- 2. Which gene has the most conserved 8-mer binding sites?
- 3. Find the microRNA seed of previously identified mature microR NA. Does it match the positions in the mature microRNA?

10 nt

Sol. 4 microRNA seed

1045 transcripts with conserved sites, containing a total of 1209 conserved sites and 579 poorly conserved sites.

Genes with only poorly conserved sites are not shown.

[View top predicted targets, irrespective of site conservation]

Table sorted by cumulative weighted contex+++ score

[Sort table by predicted occupancy]

[Sort table by aggregate P_{CT}]

The table shows at most one transcript per gene, selected for being the most prevalent, based on 3P-seq tags.

microRNA target prediction

- microRNA-mRNA interactions often false-positive
- Experimental validation often indirect from high-throughput
- Integration of further information can help ensuring accuracy:
 - Site type
 - Supplementary pairing
 - Local AU
 - Minimum distance
 - 3' UTR length
 - TA (target site abundance)
 - SPS (seed-pairing stability)
 - Conservation of 3'UTR
 - Conservation of microRNA family
 - Thermodynamic stability of precursor microRNA
